6:791-806, 1996. First strand CDNA syntheeis was primed with an oligo-dT primer containing a Not I site. Double stranded CDNA was ligated to an ECOR I adaptor, digested with Not I, and cloned directionally into pT713-Pac vector. The oligonucleotide used to prime the synthesis of first-strand CDNA contains a library tag sequence that is located between the Not I site and the (dT)18 tail. The sequence tag for this library is CGATTAGGGA. This library was created for the program, Gene Discovery in the Visual System, supported by National Bye Institute (NEI)."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               268 bp mRNA linear EST 30-JAN-1997

Site 2: NotI; The poly (A) + RNA was dephosphorylated with bacterial alkaline phosphatase (BAP) and then decapped with tabacco acid pyrophosphatase (TAP). The decapped intact mRNA was ligated with DNA-RNA linker including ECORI site by treatment of T4 RNA ligase and the first strand cDNA was synthesized from oligo dT-selected mRNA by priming with dT-tailed vector. The dT-tailed vector was adjusted to have about 60nt. The cDNA vector was circularized with E. coll DNA ligase after digestion of ECORI which site is also included in vector. An RNA strand converted to a DNA alrand by Okayama-Berg method. The obtained cDNA vectors were used for transformation of competent cells E. coll Toplof' by electroporation method. The cDNA libraries constructed by this method are full-length enriched CDNA library."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         W48348 24-MAY-1996 mC86b02.rl Soares mouse embryo NbME13.5 14.5 Mus musculus cDNA clone IMAGE:355371 5', mRNA sequence.

New human genome-derived single exon nucleic acid probes useful for human gene expression analysis, for identifying or characterizing alternative splicing events, for assessing genomic alterations or as tools for

Rank DR, Hanzel DK;

Penn SG,

WPI; 2004-119264/12

The invention relates to a nucleic acid probe for measuring human gene

Claim 1; SEQ ID NO 16151; 80pp; English.

surveying tissues.

```
The invention relates to 2175 novel human ovarian antigens (ABP41054-ABP43228) and to CDNAs encoding them (ABQ54131-ABQ56305), and also encompasses polypeptides 90% identical and polymuclectides 95% identical to the sequences of the invention. The invention additionally relates to recombinant vectors and host calls comprishing human ovarian antigen to the sequences of the invention. The invention additionally relates to recombinant vectors and host calls comprishing human ovarian antigen of ovarian antigens of ovarian antigens and polymuclectides and polypeptides in diagnossing, treating, prognosing or preventing various ovary and/or breast related disorders. Such conditions include ovarian cancer and breast cancer, and metastatic tumours of ovarian or breast origin, reproductive system disorders (e.g., infertility, disorders of pregnancy, anovulation, calsorders (e.g., infertility, disorders of pregnancy, anovulation, calsorders, infections (e.g., chlamydia, HTV, toxoplasmosis, and toxic shock syndrome), inflammatory conditions (e.g., mastitis, oophoritis and immunodeficiencies, autoimmune oophoritis, systemic lupus erythematosus), cardiovascular disorders, cespiratory disorders (e.g., anaemia), cardiovascular disorders, cespiratory disorders, neurological disorders, gastrointestinal disorders and urinary system disorders. Ovarian antigen polypeptides and condities which modulate ovarian antigen expression or activity. The polymuclectides may also be used in screening for compounds which conditication of individuals and in forensic analysis, and the indense disgnosis, drug targeting and phenotyping. The present sequent in disease disgnosis, drug targeting and phenotyping. The present convention, Nore: The sequence of the present of the parent of the presents of t
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

Control of the invention relates to a nuclear acid probe for measuring human gene expression, comprising any of the 27,400 fully defined nucleotide sequences in the specification, or their complements or fragments, and encoding at least 8 amino acids of any of the 6888 amino acids sequences concing at least 8 amino acids of any of the 6888 amino acid sequences concing in the specification. The probe is a single exon probe that the fully defined in the stringency conditions to a nucleic acid molecule expressed in human cells or tissues. Also included are a spatially.

Comprising a plurality of single exon nucleic acid molecule gadressable set of single exon nucleic acid molecule or amplifiable from the plurality), a single conditions to measuring human gene expression, a wettor comprising the single exon nicroarray for measuring human gene expression, a vector comprising at least 8 conditionally with conservative amino acid substitutions, and contiguous amino acids of any of the above mentioned amino acid or contiguous amino acids of any of the above mentioned amino acid contiguous amino acids of any of the above mentioned amino acid contiguous amino acids of any of the above mentioned amino acid or contiguous amino acids of any of the above mentioned amino acid or acustomer desiring to measure gene expression, a method of providing that binds specifically to a peptide cited above.

Complete antibody that binds specifically to a peptide cited above.

Sequences (obtionally with conservative amino acid substitutions), and acustomer desiring to measure gene expression and accomputer-readable of acustomer desiring to measure gene expression and yeis. The probes methods and achase having a plurality of records throad any second including data on the expression of a single exon microarrays.

Complete accord including data on the expression of a single exon microarray to accord to contains and the accord includes their exon, in assessing contains in the genomic alterations in the genomic alterations, in the probes are 252 TGGAGATAGAGCTTCCACAGGGCTCTCTTCATGTCCTGGTTCCTCAGGCTGTAGATGAGC 193 192 GGATTCAGCGTGGGTATGAGGTAGAGACAGCACCAGCCAAGCGCCCTTCCAGCGGG 133 62 TACCTCCTGATACCCTTGAGATGCGGGTCCGAGATGGCAGCAAAATTCGCAACCTGCTGG 121 61 patent did not form part of the printed specification, but was obtained in electronic format directly from USPTO at segdata.uspto.gov/seguence.html?DocID=20030194704 2 TGGAGCACTACCGGAAAGCTGGCTCTGTAGAGCTCCCAGCGCCTTCCCCAATGCCCCAGC ö Query Match 10.5%; Score 28.6; DB 12; Length 265; Best Local Similarity 49.0%; Pred. Novel human polypeptides and polynucleotides useful for diagnosing, preventing and treating cardiovascular disease, neurodegenerative, hyperproliferative disorders and autoimmune disorders.

Disclosure; SEQ ID NO 9563; 1037pp; English.

The present invention describes substantially purified human proteins (referred to as open reading frame, ORFX, where X is 1-11491 (see Table 1) in the specification). ABM15762 to ABM27252 encode the human ORFX proteins given in ABP00010 to ABP11500. ORFX proteins are useful for treating or preventing a pathology associated with an ORFX-associated disorder in humans, and in the manufacture of a medicament for treating a syndrome associated with ORFX-associated disorder. ORFX polymucleotide sequences can be used in gene therapy. ORFX sequences can be used in gene therapy. ORFX sequences can be used in the tendence of a medicament of cancer, hyperproliferative disorders, cirrhosis of liver, psoriasis, benigh tumours, keloid, degenerative disorders related to organ transplantation, cardiovascular diseases, disorders related to organ transplantation, cardiovascular diseases, diabetes mellitus, systemic storage disease, various immune deficiencies and disorders, infectious disease, autoimmune disorders such as multiple sclerosis, rheumatoid arthritis, autoimmune inflammatory eye disease. ORFX proteins are also useful for treating burns, incisions, ulcers, for treating osteoporosis, bone degenerative disorders, or periodontal disease, and for gut to protection or treatment of lung or liver fibrosis, reperfusion injury in various tissues and conditions resulting from systemic cytokine damage. N.B. The sequence data for this patent did not form and the printed specification, but was obtained in electronic form part of the printed specification, but was obtained in electronic. cormat directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

Penn SG, Rank DR, Hanzel DK;

WPI; 2004-119264/12.

New human genome-derived single exon nucleic acid probes useful for human gene expression analysis, for identifying or characterizing alternative splicing events, for assessing genomic alterations or as tools for surveying tissues.

Claim 1; SEQ ID NO 18496; 80pp; English.

The invention relates to a nucleic acid probe for measuring human gene expression, comprising any of the 27,400 fully defined nucleotide expression, comprising any of the 27,400 fully defined nucleotide expression, or their complements or fragments, and encoding at least 8 amino acids of any of the 6888 amino acid sequences fully defined in the specification. The probe is a single exon probe that hybridises under high stringency conditions to a nucleic acid molecule expression (comprising a plurality of single exon nucleic acid molecule or addressable set of single exon nucleic acid probes for measuring human cells or amplifiable from the plurality), a single comparately and addressably isolatable or amplifiable from the plurality), a single exon microarray for measuring human gene expression, a wetto comprising the single exon probe cited above, an ORF-encoded peptide comprising at least 8 contiguous amino acids of any of the above- mentioned amino acid of supervalve amino acid and/or licensing single exon probes or microarrays to measure gene expression, a method of solated antibody that binds specifically to a peptide cited above, manno gene expression, a method of such a customer desling and/or licensing single exon probes or microarrays to the corage medium which contains a database having a plurality of records cach record including data on the expression of a single exon probe cited above. The probe, methods and apparatus are useful in gene expression analysis. The probes methods and apparatus are useful in gene expression analysis. The probes methods and apparatus are useful in dene expression analysis. The probes methods and apparatus are useful in dene expression analysis. specific exon, or in constructing genome-derived single exon microarrays. In addition, the probes are used in identifying and characterising alternative splicing events, in detecting and characterising gross alterations in the genomic locus that includes their exon, in assessing smaller genomic alterations, in priming the synthesis of nucleic acids, or in expressing the ORF-encoded peptide. The present sequence is a human single exon probe of the invention. Note: The sequence data for this

cc sof a dog dopamine receptor D4 gene, breeding useful dog candidates that uses a dog in which the genotype of the allele in exon 1 or intron 2 of a dog dopamine receptor D4 gene is homozypetic for at least one of the parent dogs and a useful dog candidate that is selected based on the parent dogs and a useful dog candidate that is selected based on the genotype of the allele in exon 1 or intron 2 of a dog dopamine receptor 04 gene. The service dogs are seeing-eye dogs, disaster rescue dogs, assisting dogs, narcotics detection dogs, police dogs for the hearing impaired, animal herding dogs, or hunting dogs. The dogs with comparing the short form of exon 1 are watchdogs or housedogs. Dogs having the short form of intron 2 display mild-mannered behavioural traits and dogs having the long form of intron 2 display aggressive behavioural traits. The polynucleotides and polypeptides are useful for screening useful dog candidates having genetic aptitudes beneficial to companie the probes used in southern hybridisation, northern department of dopamine receptor D4, DRD4, intron 2 long form.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ADF31067,
                    The invention relates to a polynucleotide derived from dog dopamine receptor D4 (DRD4) comprising the short and long forms of exon 1 (ADQ91952 and ADQ91954) or the deleted portion from the long form ADQ91950), and the short and long forms of intron 2 (ADQ91957and ADQ91958 or the deleted portion of the long form (ADQ91956). Also included are a transformant in which a polynucleotide is expressively introduced that contains a nucleotide sequence selected from ADQ91950, ADQ91952, ADQ91954, ADQ91955, ADQ91957 and ADQ91958, a polypeptide containing an amino acid sequence encoded by the above nucleic acids (ADQ91953 or ADQ91955, screening for useful dog candidates, a kit for screening for useful dog candidates comprising a pair of PCR primers that bonds to the vicinity of both terminals of an allele in exon 1 or intron

together, especially for developing new enzymes; (ii) in washing and cleaning compositions for textiles or hard surfaces; (iii) for treating arm materials and intermediates in preparation of textiles, especially desizing of cotton; (iv) for starch liquefaction, especially in ethanol production; (v) for preparation of linear and/or short-chain oligosaccharides; (vi) for hydrollysis of cyclodextrins; (vii) for compounds from polysaccharide complexes or cyclodextrins; (viii) in preparation of foods and animal feeds, e.g. as antistaling additives for bread; (ix) for destroying starch-based and the same and (x) as temporary adhesives. Nucleic acid encoding the novel glycosyl hydrolases and their derivatives can be fused to other nucleic acid, especially for development of new enzymes. This sequence encodes a soil metagenome glycosyl hydrolase homologue.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present sequence is given in a specification relating to compounds for therapy and diagnosis of lung cancer. Polypeptides comprising at least an immunogenic part of a lung tumour protein are disclosed. The polypeptides are useful for inhibiting the development of cancer,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to isolated lung tumour-specific proteins and their corresponding cDNA molecules. Lung tumour-specific proteins and their antigen-presenting cells are useful for stimulating and/or expanding T cells specific for a tumour protein, and for inhibituing the development of cancer. The invention also relates to a composition useful for stimulating an immune response, and for treating cancer. The lung tumour specific oligonuclectide is useful in gene therapy and for diagnosis, detection and treatment of lung cancer. The present sequence is human
                                                                                                                                                                                                                                                                                                                                                                                                                                                   175 GGTTCTGGCAGGGCTGCAGGAAAGGCTGTCAGCTGCGCTGAGATTGTCAAGCGGCGGGTC 234
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 especially lung cancer. Samples of T cells expressing the polypeptides may be used to inhibit the development of cancer. The polypeptides are also useful for detecting and monitoring the progression of cancer,

Sequence 264 BP; 52 A; 69 C; 63 G; 74 T; 0 U; 6 Other; differential display RT-PCR relating to the invention.

SXS

```
The invention relates to a novel isolated polymucleotide comprising one of 32 47-6080 base pair sequences, given in the specification, or their complements or degenerate veriants, at least 20 contiguous residues of a sequence in, or having at least 75 or 90 % identity with the isolated polymucleotide, or that hybridise with the polymucleotide. The invention further comprises: an isolated polymeptide; an expression vector comprising the polymucleotide operably linked to an expression control sequence; a host cell transformed or transfected with the expression control vector; an isolated antibody or its antigen-binding fragment that specifically binds to the polymptide; a method for detecting the polymptide; an objayoutleotide that hybridises to the isolated coll population; a composition conditions; a method for stimulating and/or expanding T cells specific for a tumour protein; a stimulating of carriers and immunostimulants and a second component; a method for stimulating an immuno response in a patient; a method for retaining cancer in a patient; a method for parient: a patient of the composition of the parient of the parient of the composition of the parient of the parient of the composition of the parient of the composition of the parient of the parient of the

```

patient; a diagnostic kit comprising at least one oligonuclectide or antibody and a detection reagent comprising a reporter group; and a method for inhibiting the development of cancer in a patient. The compositions of the invention have cytostatic activity and can be used to create a vaccine. The isolated polynuclectide is useful for preparing a composition for diagnosing, treating or preventing cancer. This polynuclectide sequence represents an isolated 3' sequence used in the preparation of human lung tumour-specific cDNA sequences using

```
The invention relates to polynuclectides encoding lung tumour antigens. The invention also relates to the polypeptides encoded by the polynuclectides, isolated antibodies or antigen-binding fragments that specifically bind the polypeptides and a method for detecting cancer in a patient, comprising obtaining a biological sample from the patient, contacting the sample with a binding agent that binds a polypeptide of the invention, detecting in the sample an amount of polypeptide that brinds to the binding agent, and comparing the amount of polypeptide to a predetermined cut-off value. T cells specific for a tumour protein can be stimulated and/or expanded by contacting the T cells with a polypeptide, polymucleotide or an antigen-presenting cell that expresses a

polypeptide. Cancer development can be inhibited by incubating CD4+ and/or CD8+ T cells isolated from a patient with a polypeptide, polynucleotide or an antigen-presenting cell that expresses a polypeptide, so that the T cells proliferate. The invention is used to stimulate an immune response or to detect or treat a cancer in a patient, particularly lung cancer. This sequence represents human lung tumour antigen cDNA of the invention. Note: The sequence data for this patent did not form part of the printed specification but was obtained in electronic format from USPTO at seqdata.uspto.gov/sequence.html.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention relates to human single exon nucleic acid probes (SENP). The present sequence is one such probe. The SENPs are derived from human HeLa cells. The SENPs can be used to produce a single exon microarray, which can be used for measuring human gene expression in a sample derived from human cervical epithelial cells. By measuring gene expression, the probes are therefore useful in grading and/or staging of diseases of the cervix, notably cervical cencer. Note: The sequence data for this patent did not form part of the printed specification, but was

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to a single exon nucleic acid probe for measuring human gene expression in a sample derived from human foetal liver. The single exon nucleic acid probes may be used for predicting, measuring and displaying gene expression in samples derived from human fetal liver. The present sequence is a single exon nucleic acid probe of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human genome-derived single exon nucleic acid probes useful for analyzing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                       84
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human; foetal liver; gene expression; single exon nucleic acid probe; ss
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    84

The present invention relates to single exon nucleic acid probes for measuring human gene expression in a sample derived from human heart. The present sequence is one such probe. The probes may be used for predicting, measuring and displaying gene expression in samples derived from the human heart via microarrays. By measuring gene expression, the probes are useful for predicting, diagnosing, grading, seraging, monitoring and prognosing diseases of the human heart and vaccular system e.g. cardiovascular disease, hypertension, cardiac arrhythmias and congenital heart disease. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic form at directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                      Single exon nucleic acid probes for analyzing gene expression in human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 114 CCTGCTGGGGTTGGCTCTGGGTCGGTTGGAGGCGGCAGTGCTGGCATGTAGTGTTCTC

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention relates to single exon nucleic acid probes (SENP). The present sequence is one such probe. The probes are useful for producing a microarray for predicting, measuring and displaying gene expression in samples derived from human placenta. The probes are useful for antenatal diagnosis of human genetic disorders
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Probe #23118 used to measure gene expression in human placenta sample.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

Novel polynucleotide useful for detecting single nucleotide polymorphisms in human gene.

Claim 1; SEQ ID NO 89; 704pp; Japanese.

The invention relates to a novel polymucleotide isolated and purified from a human gene having any one of 915 fully defined sequences as given in specification, or a sequence having a base substitution. The invention further relates to: an oligomucleotide containing single nucleotide polymorphisms; a PCR primer set chosen from the combination of two DNA fragments from any one of 1220 fully defined sequences as given in specification; a labelling probe containing the SNP containing oligo; and a microarray equipped with the SNP containing oligo. The isolated human gene of the invention is useful for detecting the single nucleotide polymorphisms in human gene. The isolated human gene is also useful for diagnosis of disease and determination of side effect to a medical agent. The isolated human gene is also effective in detecting single nucleotide plumorphisms in a human gene. This polymucleolide sequence represents one of the 935 isolated polynucleotides from a human gene of the

in the invention

reactivity and reproducibility); also synthetic probes are generally shorter than probes prepared by polymerase chain reaction. ACD68731 to ACD81540 represent oligonucleotide probes used with the biochip described

This invention describes a novel biochip comprising probe spots, each containing many identical probes. The probes are nucleotide sequences of 30-80 bases, are prepared ex situ from synthetic oligonucleotides and at least one includes a segment of at least 20 bases identical with, or complementary to, a segment of an open reading frame (orf) of Escherichia (orl K12. The blochip is used for specific detection of gene expression in K12 and for determining the gene expression pattern, e.g. for diagnostic determination of which E. coli strains are present in the gut, and to determination of which E. coli strains are present in the gut, and to determine the effects of e.g. growth media on gene expression. The blochip provides as comprehensive as possible detection of the K12. Conting provides as comprehensive of many different genes with a single genome, with simultaneous analysis of many different genes with a single cypric, and comparison of gene expression, it also allows measurements of population densities for the various strains. The use of synthetic oligonucleotides for preparation of probes allows free

The invention discloses isolated PRO secreted/transmembrane polypeptides and the muclets caid encoding them. The polypeptides can be used to raise antibodies that specifically bind to the PRO polypeptide for linking a bioactive molecule to a cell expressing a PRO polypeptide are useful for modulating and confecting other PRO polypeptides are useful for detecting other PRO polypeptides in a sample and for linking a bioactive molecule to a cell expressing a PRO polypeptides are useful for modulating the biological activity of a cell expressing PRO polypeptides. The PRO polypeptides or polypeptides are useful for modulating the biological activity of a cell expressing PRO polypeptides. The PRO polypeptides or polymetic and the processor or polymetic and are useful for stimulating hypertrophy of monatal heart, inhibiting vascular endothelial cells, modulating the proliferation of endothelial cells, modulating the proliferation of endothelial cells, modulating proliferation of endothelial cells, inducing proliferation of ethoracoves, enhancing the survival or proliferation of endothelial cells, modulating of software control or treating datoracoves. In particular, these are useful for ethoracoves or properties or proliferation of chondrocytes, inducing proliferation of chondrocytes, cup. Myperinal neurons or rod phocroceptor cells, inducing proliferation of chondrocytes, cup. Appendica, hypotimenial cells, modulating or bossity, diabetes, hypotimical profices are useful for ethoracoves or properties and their portions are useful in manmals. PRO polypeptides and their portions affect the expression of genes which have a role in cell death. The polymucleotides are useful in molecular biology including uses as hybridiation of entrempended or properties and properties of therapeutically useful research or properties and processed or combinantly expressing the protein and for the development and screening of therapeutic angents, for generating component and provesses as therapeutic gents of native processes of supplied a
 purification of PRO from recombinant cell culture or natural sources. The PRO genes may also be used in gene therapy, particularly for replacing a defective gene. The sequence presented is a PCR primer which was used to
encoding them useful for treating skin, neurodegenerative diseases, as antithrombotic agent and for inducing endothelial cell apoptosis.

```
The present sequence is one of a large number of 5' ESTs derived from mRNAs encoding secreted proteins. No ORF has yet been conclusively identified within the present sequence. The 5' ESTs were prepared from total human RNAs or polyA+ RNAs derived from 30 different tissues. EST sequences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from oligo-dr primed cDNA libraries. Such ESTs are not wall suited for isolating cDNA sequences derived from the 5' ends of mRNAs and even in those cases where longer cDNA sequences have been obtained, the full 5' UTR is rarely included. S' ESTs are derived from mRNAs and genomic DNAs. 5' ESTs are also used in

 The invention relates to a novel polymucleotide isolated and purified from a human gene having any one of 915 fully defined sequences as given in specification, or a sequence having a base substitution. The invention further relates to: an oligonucleotide containing single nucleotide polymorphisms; a PCR primer set chosen from the combination of two DNA fragments from any one of 1220 fully defined sequences as given in specification; a labelling probe containing the SNP containing oligo, and a microarray equipped with the SNP containing plago. The isolated human gene of the invention is useful for detecting the single nucleotide polymorphisms in human gene. The isolated human gene is also useful for diagnosis of disease and determination of side effect to a medical agent. The isolated human gene is also effective in detecting single nucleotide polymorphisms in a human gene. This polymucleotide sequence represents in a numan gene. This polymucleotide sequence represents in a numan gene of the suman gene of the

(HUMA-) HUMAN GENOME SCI INC

Rosen CA, Barash SC, Ruben SM,

WPI; 2001-483426/52.

Nucleic acids encoding human immune/hematopoietic antigen polypeptides, useful for preventing, diagnosing and/or treating cancers and metastasis.

Disclosure; SEQ ID NO 25209; 3071pp + Sequence Listing; English.

AAK54951 to AAK64702 encode the human immune/haematopoietic antigen (1)

amino acid sequences given in AAM82170 to AAM91921. (1) have cytostatic
activity, and can be used in gene therapy and vaccine production. (1)
proteins and polymucleotides may be used in the prevention, diagnosis and
treatment of diseases associated with inappropriate (1) expression. For
example, they may be used to treat disorders associated with decreased
example, they may be used to treat disorders associated with decreased
that affect the activity of (1) by expressing inactive proteins or to
supplement the patients own production of (1). Additionally, (1)
cuplement the patients own production of (1). Additionally, (1)
nucleic acids into a host cell and culturing the cell to express the
protein. (1) proteins and polymucleotides may be used to prevent,
diagnose and cract immune/haematopoietic-related diseases, especially
cancers and cancer metastases of haematopoietic antigen genomic
to AAK87694 represent human immune/haematopoietic antigen genomic
sequences from the present invention. AAK54942 to AAK64950 and AAM82169

RESULT 12
 The invention relates to a novel polymucleotide isolated and purified from a human gene having any one of 935 fully defined sequences as given in specification, or a sequence having a base substitution. The invention of further relates to: an oligonucleotide containing single nucleotide polymorphisms; a PCR primer set chosen from the combination of two DNA fragments from any one of 1220 fully defined sequences as given in specification; a labelling probe containing the SNP containing oligo; and a microarray equipped with the SNP containing the single nucleotide polymorphisms in human gene. The isolated human gene is also useful for diagnosis of disease and determination of side effect to a medical agent. The isolated human gene is also effect in detecting single nucleotide polymorphisms in a human gene. This polymorleolide sequence represents

containing many identical probes. The probes are nucleotide sequences of 30-80 bases, are prepared ex situ from synthetic oligonucleotides and at least one includes a segment of at least 20 bases identical with, or complementary to, a segment of an open reading frame (orf) of Escherichia (orl) K12. The biochip is used for specific detection of gene expression in K12 and for determining the gene expression pattern, e.g. for diagnostic determination of which E. coli strains are present in the gut, and to determine the effects of e.g. growth media on gene expression. The biochip provides as comprehensive as possible detection of the K12.

C senome, with simultaneous analysis of many different genes with a single device, and comparison of gene expression between K12 and its mutants or other E. coli strains in a single experiment. Apart from qualitative and quantitative informattion about gene expression, it also allows measurements of population densities for the various strains. The use of synthetic oligonucleotides for preparation of probes allows free
 variation in probe length and ensures high purity (and thus selectivity, reactivity and reproducibility); also synthetic probes are generally shorter than probes prepared by polymerase chain reaction. ACD68731 to ACD81540 represent oligonucleotide probes used with the biochip described

AX10269-X12937 are human DNA fragments which contain biallelic polymorphic markers which have been isolated using the primers represented in AXC09121-X10268. The base occupying the polymorphic site is indicated by the appropriate IUPAC-IUB ambiguity code. These fragments can be used in methods for determining polymorphic forms in an individual for use in e.g. forenaics, paternity testing or for phenotypic typing for diseases such as agammaglobulinemia, diabetes insipidus, Lesch-Nyhan syndrome, muscular dystrophy, Miskott-Aldrich syndrome, Pabry's disease, familial hypercholesterolemia, polycystic kidney disease, hereditary spherocytosis, von Willebrand's disease, tuberous sclerosis, hereditary spherocytosis, von Willebrand's disease, tuberous sclerosis, hereditary appearance is inflammation, cancer, diseases of the nervous syndrome, osteogenesis imperfecta, acute intermittent porphyria, autoimmune diseases, inflammation, cancer, diseases of the nervous system, infection by pathogenic microorganisms, and characteristics such as longevity, appearance (e.g. baldness, obesity), strength, speed, and ongrevity, and susceptibility or receptivity to particular drugs or therapeutic treatments. The isolated polymorphic nucleic acid segments can also be used to produce medicaments for the treatment or prophylaxis of such diseases.
 Polymorphism; biallelic; human; forensic; paternity testing; disease; detection; phenotypic typing; characteristic; infection; hereditary; autoimmune disease; cancer; inflammation; drug; therapy; medicament;
 New isolated nucleic acid segments from the human genome - used for determining polymorphic forms for use in e.g. forensics, paternity testing or phenotypic typing for disease.

 The present sequence is one of a large number of 5' ESTS derived from mRNAs encoding secreted proteins. No ORF has yet been conclusively identified within the present sequence. The 5' ESTS were prepared from total human RNAs or polyA+ RNAs derived from 30 different tissues. EST sequences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from oligo-dT primed cDNA libraries. Such ESTS are not well suited for isolating onNA sequences derived from the 5' ends of mRNAs and even in those cases where longer CDNA sequences have been obtained, the full 5' UTR is rarely included. S' ESTS are derived from mRNAs with intact 5' ends and can therefore be used to obtain full length cDNAs and genomic DNAs. 5' ESTS are also used in diagnostic, forensic, gene therapy and chromosome mapping procedures. They are used to obtain upstream regulatory sequences and to design

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
